Product Description

SGS Bright Sliver 304 Stainless Steel Sheets 1250mm Stainless Steel Sheet Metal

What is a 304 stainless steel sheet?

Grade 304 is also known for its superior machinability and formability. Also, its low yield strength and high elongation allow 304 to form all manner of complex shapes.

304 stainless steel is non-magnetic and provides low thermal and electrical conductivity. It has a higher corrosion resistance than many other stainless steel alloys.

Additionally, its weldability lends it to a number of commercial welding methods, including fusion and resistance welding. While forming [304 stainless steel sheets](#), uniform temperatures are required to be between 2300 degree F and 1700 degree F.

Another main feature of SS 304 alloy is its versatility. It is well-suited for a wide range of manufacturing applications, the reason why it is so popular across so many industries.

Its resistance to intergranular corrosion, which is normally a byproduct of stress relieving or welding, makes it well-suited for products that would not be able to use stainless steel.
